FLOOR ASSEMBLY
R20 (5") Monoglass
R48 (12") EPS Type 2
R-nominal: R-68
R-effective: R-70.75
U-value: 0.080 W/m²

WALL ASSEMBLY
R38 (9 1/4") Cellulose
R14 (3 1/2") Fiberglass Batt
R-nominal: R-52
R-effective: R-45.64
U-value: 0.124 W/m²

ROOF ASSEMBLY
R22 (5 1/2") Mineral Wool Batt
R79 (19") Cellulose
R22 (5 1/2") Fiberglass Batt
R-nominal: R-116
R-effective: R-97.72
U-value: 0.058 W/m²

Multiple Mid-sized HRVs

- More energy efficient
- Smaller units were easier to fit
- Less computers

One Large ERV

- Moisture recovery
- Individual suite controls
- Integrated cooling

1

What is Passive (Free Cooling)?

PASSIVE COOLING IN PASSIVE HOUSE

The diagram shows a cross-section of a passive house with a mechanical ventilation system. Outdoor air is drawn in through a filter and passes through a heat exchanger. The supply air is then distributed to the rooms. Return air is drawn from the rooms back through the heat exchanger and exhausted. The system is designed to maintain a constant indoor temperature and humidity while minimizing energy consumption.

- > Need the right climate zone
 - > Miami – Not good!
 - > Canada (zones 4 to 8) support passive cooling
- > Passive House projects are typically decentralized systems
 - > VRF, WHSP, Fancoil, etc.
 - > All air systems are rare
- > Passive House projects have ventilation systems

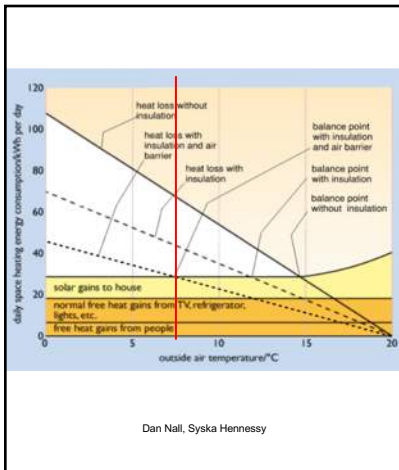

2

Leveraging the Ventilation System

PASSIVE HOUSE MURBs

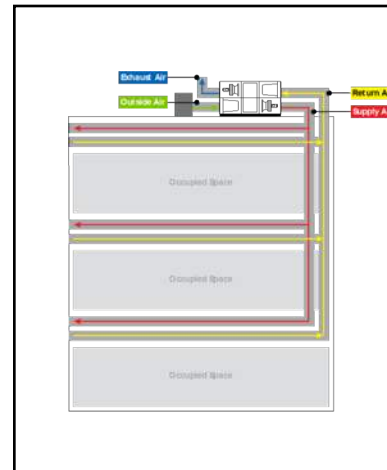

- > Volume to surface ratio much higher than single family dwellings
 - > More internal heat
- > Compared to Commercial spaces, MURBs have internal heat gains
- > Each apartment is treated as a single HVAC control zone
 - > Separate heating and AC controls
 - > Tends to promote decentralized HVAC systems like VRF, WSHPs, fancoils etc
- > There is some form of ventilation unit
 - > Decentralized (one per apartment)
 - > Centralized (several apartments using common ventilation unit)

Dan Nall, Syska Hennessy

LOW BALANCE POINT

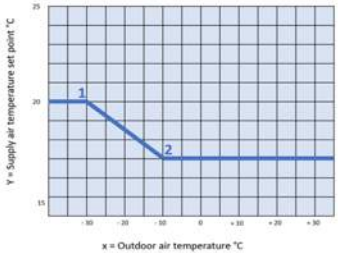

- > Passive House is very well insulated with very low leakage rates
- > Leads to a very low "Balance Point"
 - > The ambient temperature when the building swings from needing heat to needing cooling
- > Passive House balance points are around 0 °C
- > Building will need cooling when it is cold outside
- > An automatic air conditioning system will try and operate
 - > Can be hard on the equipment
- > Balance point will be reached on south side first
 - > Going to have some zones in heating mode and others in cooling mode
 - > Passive shading may not work (too early)

VENTILATION SYSTEM

- > Ventilation airflow rates usually selected for
 - > Meeting Indoor Air Quality (IAQ) goals
 - > Providing air balance in building
- > Passive House requirements in MURBS
 - > Setback (~20% less)
 - > Normal
 - > Boost mode (~20% more)
- > Opportunity to increase design airflow rate to deliver more passive cooling
- > Reset airflow rate based on
 - > Outdoor air temperature
 - > Return air temperature
 - > "Average" zone temperature

VENTILATION AIR TEMPERATURE RESET

- > Can reset supply air temperature based on outdoor air temperature
- > 72 °F (22°C) in winter
- > Reset closer to 55 °F (12.8 °C) in shoulder weather
- > Could reset supply air temperature based on return air temperature
 - > Hotter return air temperature means more cooling is required
 - > Not recommended
 - > Return air is a "blend" of multiple zones
 - > Not a good proxy for building load

Swegon

LEVERAGING THE VENTILATION SYSTEM POTENTIAL COOLING CAPACITY FROM VENTILATION AIR

Space Temperature (°F)	Supply Air Temperature (°F)	Airflow Rate (cfm)	Sensible Cooling Capacity (Btu/h-ft²)
75	55	0.11	2.4
75	55	0.165	3.6
75	50	0.11	3.0
75	50	0.165	4.5
75	45	0.11	3.6
75	45	0.165	5.4
78	55	0.11	2.7
78	55	0.165	4.1
78	50	0.11	3.3
78	50	0.165	5.0
78	45	0.11	3.9
78	45	0.165	5.9

Realistically get between 4 and 5 Btu/h-ft² Passive cooling

3

Zone Control

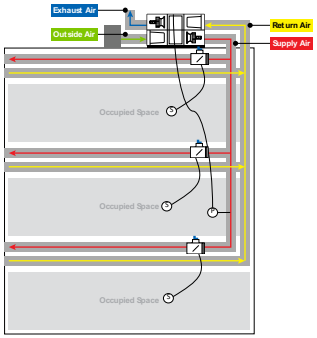

Swegon

ZONE CONTROL

- > Main issue with using ventilation system for passive cooling It will treat all apartments the same
- > All apartments will experience any adjustments to supply air temperature or supply airflow amount
 - > North side and south side

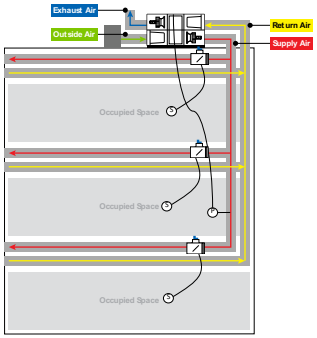

Swegon

ZONE CONTROL

- > Ventilation unit has variable flow fans
 - > Typically controlled by supply duct pressure
- > Each zone (apartment) has independent control zone damper that can vary the ventilation airflow based on apartment needs
- > Can vary airflow based on:
 - > Ventilation requirement (Setback – Normal – Boost or DCV (CO₂))
 - > Temperature (passive cooling)
 - > Humidity (dry space in winter)

Swegon

ZONE CONTROL

- > Temperature Sensor - Winter
 - > Normal ventilation airflow
 - > Control heat source for supplemental heating (i.e. EBB)
- > Temperature Sensor – Summer
 - > Increase ventilation rate for passive cooling
 - > Control cooling source (if available)

Swegon

CONTROL DAMPERS

- > Independent Dampers
 - > Measure airflow and adjust damper position to deliver required airflow regardless of upstream pressure
- > Actuator
 - > 24V
- > Controller
 - > Necessary control sequences
 - > Requires a Zone sensor (Temperature, Humidity, CO₂ etc.)
- > Standalone or Digital communications
 - > BACnet, Lonworks, Modbus etc.

5" Damper Performance	
Min. Airflow	19 cfm
Max. Airflow	190 cfm
APD	0.12 in. w.c.

Swegon

4

**Real World
Lessons Learned**

STILL EARLY DAYS

- > Hundreds of projects in design , construction and commissioning
 - > Not Many with more than years worth of operational data
- > Design concepts being adjusted based on lessons learned from commissioning and initial operation

MECHANICAL COOLING IN APARTMENTS

- > New York often has mechanical cooling
- > Several projects built with ventilation rates at "boost" level
 - > More passive cooling
- > Cooling is coming on sooner than expected
- > Betances V under construction
 - > Zone Control

PASSIVE COOLING WITH SUPPLEMENTAL COOLING AT VENTILATION UNIT

- > No zone control
- > Resetting supply air temperature on
 - > Return air temperature (poor results)
 - > Outdoor air
- > Additional mechanical cooling for summer
 - > Occupant dissatisfaction - too hot
 - > Mechanical cooling issues took a while to resolve

PASSIVE COOLING

- > Ventilation Air distributed by façade
 - > Airflow control in the shafts
- > Mechanical cooling at ventilation unit

CONTROL DAMPERS

- > Western BC
- > Variable airflow ventilation unit
 - > VRF supplemental heating and cooling
- > Has Setback – Normal - Boost Control
- > Electric BB heating
- > VAV Cooling via ventilation airflow

- > Ventilation unit uses supply air temperature reset
 - > Passive cooling
 - > Mechanical cooling (VRF)

Swegon

SUMMARY

Passive House has low Balance Point

Low Balance point causes a need for cooling during cool weather that can be met with passive cooling

Ventilation Systems Can be Used For Passive Cooling

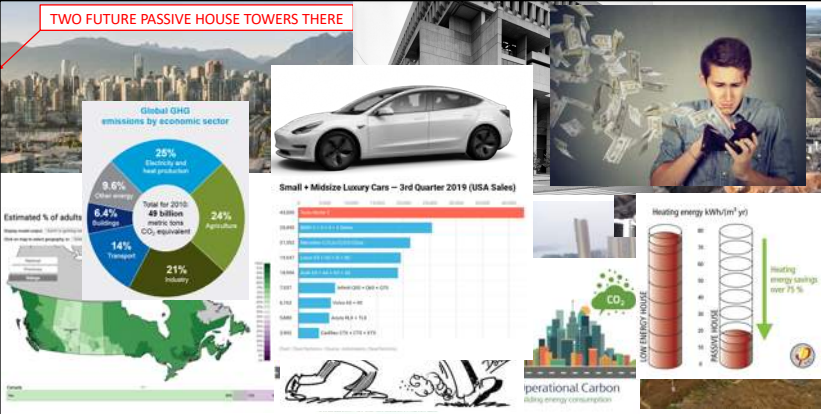

The Ventilation system can be enlarged to deliver 4-5 Btu/h-ft² of passive cooling

Controlling Passive Cooling is Challenging

Single zone cooling control is proving to be problematic
Zone control should resolve issues but adds complexity

TWO FUTURE PASSIVE HOUSE TOWERS THERE

Global GHG emissions by economic sector

28%	Electricity and heat production
24%	Agriculture
21%	Industry
14%	Transport
8.6%	Other energy
6.4%	Buildings

Total for 2018: 49 billion metric tons CO₂ equivalent
